This is a test pdf for this program and pytesseract's translation. This is how the text should look with the text going left to right and there shouldn't be unnecessary images or graphics because it might mess up the pytesseract conversion. This pdf is also the readme.

The purpose of this program is to convert the information of jpgs or pdfs into text that can be used for many purposes, such as looking for words or copying and pasting certain lines or text.

The old way of converting pdfs to text was to use a pdf to jpg converter, take all the converted jpgs, then import them into a program such as the one in west-side-story-script-tesseract-translation repository that I made. Then wait for the output and then put it in a text file.

With this program, you only need to upload a pdf to the program and then you will receive a txt file as the output after the processing is done.
